

Progress Report :

Day 1 :

First I understand what a Time Traveller Debugger actually is and how it is beneficial in code debugging . Then how to make Stack using Linked List and Its basic Operations .

Day 2 :

Make TimeLine Doubly Linked List which we will use to Traverse forward and backwards . Then some utility function used in code like validating the code . For Validating the code I use counter of depth and funCount and for reading file I made a string Lines . After Reading the whole file if depth is not equal to 0 then it shows error or funCount is equals to zero it shows error as well .

Day 3 :

Make resolve program stage . This stage tell me how can I write resolve programs using writeresolerecords and then how can we read it after that for the function patching we need to replace the byte offset where the fun name is placed to first we find that and then replace that fixed offset in file . Then our Patch is completed and our program will resolve .
